

Important: Environment Setup and Running Code

Environment Setup:

You need to have node.js installed on your computer: [Download Node.js](#)

Text Editor: I recommend using [Visual Studio Code](#) which I use throughout the course.

Source Code:

I attached the **start template** which you will need before writing any code in the course.

It includes an empty backend folder and an a starter react template.

You could create a react app yourself using the command shown in the video, but **I would strongly recommend downloading the start source code provided and following instructions in the following video** to install all required npm packages.
